# Fund Management's Comment: DWS Top Europe

Equity Funds - Europe

Data in relation to the fund or the leading unit class.

August 2024

As at 30/08/2024

## Performance Review

The European equity market saw price surges in August. The MSCI Europe appreciated by 1.6%.

In terms of sectors, communications and utilities saw significant gains. Healthcare also performed well, boosted by the temporary trend towards more defensive names. Banks also remained in their upward trajectory, buoyed by company updates regarding dividends and buybacks.

In contrast, names from the technology sector in particular were weaker, with profits being taken as part of the correction in AI-related stocks. In addition, energy underperformed, due among other things to the correction of the oil price.

DWS Top Europe also enjoyed gains in August and increased by 0.8%.

## Performance Attribution

The slight underperformance versus the MSCI Europe in August was mainly the result of single stock selection. For instance, Puma and HSBC in particular detracted from relative performance due to weak quarterly results.

Slightly negative effects also came from sector allocation and currency performance. In terms of sectors, primarily the overweight in IT and the underweight in consumer staples contributed to the slight underperformance.

However, the overweight in communications and selection in healthcare added to performance.

## Current Positioning

DWS Top Europe remained almost fully invested as of the end of August.

Financials, technology and communications have the highest overweights. In these sectors, the fund management focuses on structurally well-positioned companies likely to achieve above-average earnings growth foremost due to their positioning or their end markets.

Defensive consumer staples are among the largest underweights. This is due primarily to the very high valuation premium and the weaker earnings development of the sector in comparison to other defensive industries.

## Outlook

After a very weak start to the month, in which technology and cyclical stocks in particular were sold off, European equity markets rebounded strongly as the month continued, continuing the strong performance seen since the beginning of the year.

All in all, the base scenario of lower inflation rates and hopes of further possible interest rate cuts this year remains intact for the European equity markets.

The main drivers of the correction in the European equity markets at the beginning of August were a combination of factors. Specifically, these included the sharp rise in initial jobless claims in the US. In addition, some companies issued weaker than expected outlooks during the corporate reporting season, which led to uncertainty. Last but not least, geopolitical tensions in the Middle East caused uncertainty in the stock markets once again.

This was followed by a significant recovery in equity markets over the course of August. In addition to the improvement in the euro area services PMI, the fact that euro area inflation fell to a three-year low was a particular source of relief. In addition, Fed Chair Powell's indications of a September rate cut in the US became more feasible, which also fueled the fantasy of further ECB rate cuts.

In the coming weeks, the equity markets will be caught between the ongoing geopolitical tensions on the one hand, and growing optimism regarding further interest rate cuts and an economic recovery on the other.

### **Opportunities**

In accordance with the investment policy.

### **Risks**

- The fund invests its assets in selected regions or sectors. This increases the risk that the fund may be negatively influenced by the economic and political conditions in the respective regions or sectors.
- The fund invests in equities. Equities are subject to strong price fluctuations and thus also to the risk of price decreases.
- Due to its composition/the techniques used by the Fund management, the investment fund has elevated volatility, i.e. the share price may be subject to significant fluctuations up or down within short periods of time. The share value may fall below the purchase price at which the customer acquired the share at any time.

Investor profile: Growth-oriented

The Fund is intended for the growth-oriented investor seeking returns higher than those from capital market interest rates, with capital growth generated primarily through opportunities in the equity and currency markets. Security and liquidity are subordinate to potential high returns. This entails higher equity, interest rate and currency risks, as well as default risks, all of which can result in a loss of capital.

## Morningstar Style Box™

The Morningstar Style Box™ illustrates the Fund's investment strategy. For equity funds the vertical axis shows the market capitalization of the stocks contained in the portfolio and the horizontal axis shows the investment style (value, neutral or growth). For bond funds the vertical axis shows the average credit quality of the bonds in the portfolio and the horizontal axis shows interest rate sensitivity as measured by the maturity of a bond (short, medium or long).

Please note that the information from Morningstar and Lipper Leaders relates to the previous month.

## General information

When the custodian sets the price on the last trading day of the month there can be a difference of up to ten hours between the times at which the fund price and the benchmark are calculated. In the event of strong market movements during this period, this may result in the over- or understatement of the Fund's performance relative to the benchmark at the end of the month (this is referred to as the "pricing effect").

Subscriptions can only be made and units held in accordance with the terms set out in the current version of the sales prospectus, the prospectus and/or the KID (Key Information Document) .

## General Risk Warnings

Any investment in units of a collective investment scheme entails or is associated with equity market, bond market, exchange rate, interest rate, credit, volatility and political risks. Each of these risks may appear in connection with other risks. A brief description of some of these risk factors is provided below.

Prospective investors should have previous experience with the financial instruments that are in use in the specified investment policy. Investors should fully understand the risks associated with investments in fund units and only make investment decisions after consulting with their legal, tax, financial or other advisors in regards to (i) the suitability of an investment in units in view of their personal tax and financial position and/or other circumstances; (ii) the information contained in this prospectus; (iii) the investment policy of the collective investment scheme; and (iv) the risks associated with the investment under the planned investment policy presented by the collective investment scheme.

Please note that investments in collective investment schemes entail both opportunities on the upside and risks on the downside. Units of collective investment schemes are securities and as such their value fluctuates with the rise and fall in the value of the underlying assets. The value of the units may accordingly rise above or fall below the purchase price. No guarantee therefore is given that the objectives of the investment policy will be achieved. Past performance is not necessarily a guide to future returns.

## Alpha

A measure of the difference between the risk-adjusted return on an investment and a benchmark. The alpha measures the part of the performance that cannot be explained by market movements or market risk, but rather is derived from the selection of securities within the market. Alpha is a way of measuring the active contribution to performance made by the portfolio manager. It is also a good yardstick to use when comparing several funds. The figure is calculated on a 3-yearly basis.

## Average dividend yield

Measures the average dividend amount, based on the current share price. This figure is calculated based on the shares (including ADRs/GDRs - > Depositary receipts) and REITs contained in a fund.

## Average market capitalization

Measures the average market capitalization of the shares, REITs and ADRs/GDRs (depository receipts) contained in a fund. The market capitalization represents the total market value of a company as determined by multiplying the number of shares issued by the current share price.

## Beta factor

A measure of sensitivity - given as the average percentage change in the price of a fund when the market (benchmark) rises or falls by 1%. A value over (under) 1 means that on average the fund exhibits more (less) volatility than the benchmark. The figure is calculated on a 3-yearly basis.

## Correlation coefficient

Describes the degree to which two values (fund versus benchmark) move in the same direction. The value of the correlation coefficient is between -1 and +1. A correlation of +1 means that the fund generally moves in the same direction as the benchmark, while -1 indicates that the fund generally moves in the opposite direction. A correlation of 0 means that there is no relation between the price movements of the fund and the benchmark. The figure is calculated on a 3-yearly basis.

## Coupon

The coupon is the portfolio's average weighted coupon.

## Duration (in years/in months)

A measure of the sensitivity of an investment to changes in interest rates. Duration, which was developed by Frederick Macaulay, is the average period for which invested capital is committed. Because of the interest payable over time on the invested capital, duration is shorter than -> maturity. This version of duration is used in DWS Top Reporting and refers to invested assets (without "Cash and other holdings").

## Information ratio

The information ratio measures the difference between the annualized average return of the fund and that of the benchmark, divided by the Tracking error. The higher this value is, the more the investor compensated for the risk in the fund. The figure is calculated on a 3-yearly basis.

## Maximum drawdown

The maximum drawdown is the largest percentage drop in value in a given period of time. It measures the amount the fund falls from its highest point to its lowest point in the selected timeframe. The figure is calculated on a 3-yearly basis.

## Modified duration (in years/in months)

Serves as a measure of interest-rate sensitivity. Modified duration indicates the percentage change in price of a bond (in a portfolio) when the market interest rate changes by 1%. In order to calculate the percentage change in the bond price, the modified duration of the bond is multiplied by the percentage change in the interest rate. This figure helps investors assess the risks and opportunities of a bond at a glance.

## Sharpe ratio

A measure of risk developed by William F. Sharpe, defined as the excess return on an investment over that of a risk-free investment in relation to the risk of the investment. The higher the Sharpe ratio, the higher the return the investor receives for the risk the investment carries (expressed in volatility). The Sharpe ratio can be used to compare multiple funds. The figure is calculated on a 3-yearly basis.

## Tracking error

The tracking error is the standard deviation of the yield differential between a fund and its benchmark. This makes it a measure of how well the fund manager tracks the benchmark. The figure is calculated on a 3-yearly basis.

## VaR (Value at Risk)

A measure of risk that indicates the maximum fund losses with a given probability for a given period of time (holding period). VaR is calculated on the basis of the daily prices of the individual securities contained in the portfolio for a year.

## Weighted Average Life

The weighted average life of the times of the principal repayments of a liability, i.e. a bond. Refers to invested fund assets (without "Cash and other holdings").

## Yield

The yield is the annual return on a capital investment, measured as the actual interest earned (effective yield) on the capital invested. It is based on the fund's income (e.g., interest, dividends, realized capital gains) and change in the price of the assets held in the fund. The yield of a fund is

derived from the invested assets (without "Cash and other holdings") and is presented as a "gross" figure, i.e., before the deduction of total expenses/fee.

**Volatility**  
Volatility expresses the degree to which the yield on an investment (the price performance of a fund, for example) varies from a mean value in a specific period of time. This makes it a measure of fund risk. The greater the variation from the mean, the higher the volatility. Knowing the volatility allows investors to assess how uncertain the return potential of an investment is. The figure is calculated on a 3-yearly basis.
