Fund Data

Investment Policy

The traditional DWS equity fund is characterized by a flexible investment policy that is not rigidly oriented to index weightings – stock selection is pure stock picking based on a fundamental approach. The fund management concentrates on blue chips around the globe, taking care to achieve a mix of financially strong and growth-oriented companies that is appropriate to the market situation. The investment universe is among others defined by environmental and social aspects and principles of good corporate governance. The fund is actively managed.

Fund Management's Comment

You can find the Fund management's detailed commentary in DWS Flagship Fund Reporting and on the individual pages of the factsheets.

(1) The Total Expense Ratio (TER) generally includes all expense items charged to the Fund apart from transaction costs and performance fees. If the Fund invests portions of its assets in target funds, the costs of the respective target funds will also be taken into account. The Fund incurred the total expenses listed here in its last financial year, which ended on 30/09/2024. They are subject to change from year to year.

Important notice: Distribution agents such as banks or other investment service providers may report costs or expense ratios to interested investors that may differ from and exceed the costs described here. This may be due to new regulatory requirements for the calculation and reporting of costs by these distribution agents, in particular as a result of the implementation of Directive 2014/65/EU (Markets in Financial Instruments Directive - "MiFID2 Directive") from January 3, 2018.

# Fund Management's Comment: DWS ESG Akkumula

Equity Funds - Global

Data in relation to the fund or the leading unit class.	April 2025	As at 30/04/2025
---	------------	------------------

## Performance Review

April began with a shock to the global trade order when President Trump announced global tariffs on "Liberation Day," with a base tariff of 10% on all US imports as well as significantly higher tariffs for partners classified as "bad actors." As a result, the equity markets experienced their sharpest falls since the Covid crisis. Following a flight from US assets and a sell-off on the bond market – illustrated by the significant depreciation of the Dollar against other major currencies – the plans were postponed by 90 days. Trump's verbal attacks on the head of the US central bank (the Fed) were also unhelpful. The volatility index jumped significantly and was close to historic highs. In Europe, the ECB lowered its key interest rate for the seventh time by 25 basis points. Toward the end of the month, the markets recovered noticeably and offset the monthly losses. The recovery in share prices was supported by hopes of a possible easing in the trade conflict, better-than-expected quarterly results and solid US labor market figures. The volatility index normalized somewhat, and interest rates on long-term US government bonds also gave up some of their gains. The S&P 500 Index fell by 0.7%, while the growth-oriented NASDAQ Index rose by 0.9% (both in US Dollars). In Europe, the MSCI Europe fell by 0.7%, while the DAX was up 1.5% (both in euro). The euro appreciated by nearly 5% against the US Dollar over the course of the month. In Japan, the Nikkei 225 rose by 1.2% (in Yen), while the Yen remained unchanged against the euro. Equities in the emerging markets ended the month up 1.3% (in US Dollars). Energy was the weakest sector in April, weighed down by low oil prices. Healthcare, raw materials, and financial stocks were also among the losers. IT and communications service providers and basic consumer goods companies, on the other hand, were the best-performing sectors.

## Performance Attribution

DWS ESG Akkumula lost 3.9%, but thus fared slightly better than the MSCI World (total return, in euro), which fell by 4.1%. The different valuation dates had no significant impact on the relative performance of the Fund in April. Over the past month, both selection and allocation effects have influenced the relative performance of the Fund. The Fund benefited from its underweight in the energy sector. The selection in the consumer sector (both discretionary and basic consumption) also paid off in April. On the negative side, overweight and selection in the healthcare sector as well as selection in IT stocks weighed on performance.

## Current Positioning

The Fund's basic positioning remains long term. More significant changes in the weightings are due to the different performance and the changed composition of individual sectors. The focus on equities of companies with sustainable, growth-oriented business models, solid balance sheets, strong management and attractive valuations continues to characterize the composition and is highly relevant, especially in times of equity market turbulence. This approach results in a focus on highly innovative technology companies, consumer companies with strong brand names and healthcare stocks with good research capabilities and promising new drugs. By contrast, companies in the commodities and energy sectors are only considered selectively, if at all, as a lack of discipline in expanding capacity and direct dependence on commodity prices can be detrimental to long-term share price performance. This also applies to the utilities industry, where regulatory interventions, such as the global energy transition, also lead to uncertainties. Another area of focus is Asian technology stocks, which are often at the forefront of global technological progress. In addition, health stocks remain heavily weighted on a global basis. In addition to the attractive positioning of many companies, the relatively favorable valuation and the aging society in industrialized countries also play a role. The Fund will continue to avoid major active currency positioning against the benchmark.

## Outlook

The geopolitical situation remains bleak due to the war in Ukraine, the conflicts in the Middle East and the new trade policy in the US. The relationship between the US and China in particular is also tense. In Europe, developments in Ukraine will have to be monitored closely, including with regard to the security of energy supply in the region. Turbulence in the Chinese real estate market and the weakening of economic growth in China have added a further risk factor that could impact global economic development. With inflation growth rates having slowed worldwide, at least further tightening of monetary policy seems unlikely. On the contrary, many of the world's leading central banks have already lowered interest rates. The impact of the new US administration on the global trade order is being closely monitored. Significant fluctuations are to be expected. The emerging markets continue to face major challenges but should in all likelihood remain a driver of the global economy, albeit more in the medium term. Short-term fluctuations in emerging market investments are likely to continue in the future. Historically, the equity markets have proven to be one of the most attractive investment areas. However, movements in the interest rate markets and their impact on equities will continue to require close monitoring.

### Opportunities

In accordance with the investment policy.

### Risks

- The fund invests in equities. Equities are subject to strong price fluctuations and thus also to the risk of price decreases.
- The fund may also invest in assets that are not denominated in euro. This can result in your investment falling in value if the euro exchange rate against these currencies increases.
- Due to its composition/the techniques used by the Fund management, the investment fund has elevated volatility, i.e. the share price may be subject to significant fluctuations up or down within short periods of time. The share value may fall below the purchase price at which the customer acquired the share at any time.

Important note on the investor profile:

Investor profile: Growth-oriented

The sub-fund is designed for growth-oriented investors who wish to achieve capital appreciation primarily through equity gains and exchange rate movements. Expected earnings are offset by high equity, interest rate and currency risks as well as creditworthiness risks and the possibility of heavy losses of the invested capital, up to the total amount invested. The investor is willing and able to bear such a financial loss, and does not prioritize capital preservation.

The Company provides additional information relating to the profile of the typical investor or target customer group for this financial product to distribution agents and distribution partners. If the investor is advised on the acquisition of units by the Company's distribution agents or distribution partners, or if they act as brokers in the purchase of units, they may also provide the investor additional information that also relates to the profile of the typical investor.

Supplementary information on the target market and product costs resulting from the implementation of the MiFID2 Directive and made available to distribution agents by the capital management company can be obtained in electronic form from the Company's website at [www.dws.com](http://www.dws.com).

## Important Notice

When the custodian sets the price on the last trading day of the month there can be a difference of up to ten hours between the times at which the fund price and the benchmark are calculated. In the event of strong market movements during this period, this may result in the over- or understatement of the Fund's performance relative to the benchmark at the end of the month (this is referred to as the "pricing effect").

DWS Investment GmbH, 2025

## Alpha

A measure of the difference between the risk-adjusted return on an investment and a benchmark. The alpha measures the part of the performance that cannot be explained by market movements or market risk, but rather is derived from the selection of securities within the market. Alpha is a way of measuring the active contribution to performance made by the portfolio manager. It is also a good yardstick to use when comparing several funds. The figure is calculated on a 3-yearly basis.

## Average dividend yield

Measures the average dividend amount, based on the current share price. This figure is calculated based on the shares (including ADRs/GDRs - > Depositary receipts) and REITs contained in a fund.

## Average market capitalization

Measures the average market capitalization of the shares, REITs and ADRs/GDRs (depositary receipts) contained in a fund. The market capitalization represents the total market value of a company as determined by multiplying the number of shares issued by the current share price.

## Beta factor

A measure of sensitivity - given as the average percentage change in the price of a fund when the market (benchmark) rises or falls by 1%. A value over (under) 1 means that on average the fund exhibits more (less) volatility than the benchmark. The figure is calculated on a 3-yearly basis.

## Correlation coefficient

Describes the degree to which two values (fund versus benchmark) move in the same direction. The value of the correlation coefficient is between -1 and +1. A correlation of +1 means that the fund generally moves in the same direction as the benchmark, while -1 indicates that the fund generally moves in the opposite direction. A correlation of 0 means that there is no relation between the price movements of the fund and the benchmark. The figure is calculated on a 3-yearly basis.

## Coupon

The coupon is the portfolio's average weighted coupon.

## Duration (in years/in months)

A measure of the sensitivity of an investment to changes in interest rates. Duration, which was developed by Frederick Macaulay, is the average period for which invested capital is committed. Because of the interest payable over time on the invested capital, duration is shorter than -> maturity. This version of duration is used in DWS Top Reporting and refers to invested assets (without "Cash and other holdings").

## Information ratio

The information ratio measures the difference between the annualized average return of the fund and that of the benchmark, divided by the Tracking error. The higher this value is, the more the investor compensated for the risk in the fund. The figure is calculated on a 3-yearly basis.

## Maximum drawdown

The maximum drawdown is the largest percentage drop in value in a given period of time. It measures the amount the fund falls from its highest point to its lowest point in the selected timeframe. The figure is calculated on a 3-yearly basis.

## Modified duration (in years/in months)

Serves as a measure of interest-rate sensitivity. Modified duration indicates the percentage change in price of a bond (in a portfolio) when the market interest rate changes by 1%. In order to calculate the percentage change in the bond price, the modified duration of the bond is multiplied by the percentage change in the interest rate. This figure helps investors assess the risks and opportunities of a bond at a glance.

## Sharpe ratio

A measure of risk developed by William F. Sharpe, defined as the excess return on an investment over that of a risk-free investment in relation to the risk of the investment. The higher the Sharpe ratio, the higher the return the investor receives for the risk the investment carries (expressed in volatility). The Sharpe ratio can be used to compare multiple funds. The figure is calculated on a 3-yearly basis.

## Tracking error

The tracking error is the standard deviation of the yield differential between a fund and its benchmark. This makes it a measure of how well the fund manager tracks the benchmark. The figure is calculated on a 3-yearly basis.

## VaR (Value at Risk)

A measure of risk that indicates the maximum fund losses with a given probability for a given period of time (holding period). VaR is calculated on the basis of the daily prices of the individual securities contained in the portfolio for a year.

## Weighted Average Life

The weighted average life of the times of the principal repayments of a liability, i.e. a bond. Refers to invested fund assets (without "Cash and other holdings").

## Yield

The yield is the annual return on a capital investment, measured as the actual interest earned (effective yield) on the capital invested. It is based on the fund's income (e.g., interest, dividends, realized capital gains) and change in the price of the assets held in the fund. The yield of a fund is

derived from the invested assets (without "Cash and other holdings") and is presented as a "gross" figure, i.e., before the deduction of total expenses/fee.

## Volatility

Volatility expresses the degree to which the yield on an investment (the price performance of a fund, for example) varies from a mean value in a specific period of time. This makes it a measure of fund risk. The greater the variation from the mean, the higher the volatility. Knowing the volatility allows investors to assess how uncertain the return potential of an investment is. The figure is calculated on a 3-yearly basis.
